Lipoteichoic acid (LTA) from gram-positive bacteria can stimulate monocytes to produce cytokines. To ascertain whether aggregation of LTA receptors can contribute to this effect, human monocytes were sensitized with LTA from Streptococcus pyogenes, washed, and treated with anti-LTA antibodies. The addition of anti-LTA antibodies or F(ab')2 fragments

**EFFECT OF MONOCLONAL ANTIBODIES AGAINST LIPOTEICHOIC -ACID FROM THE ORAL BACTERIUM STREPTOCOCCUS-MUTANS ON ITS ADHESION AND PLAQUE-ACCUMULATION IN-VITRO**

ABSTRACT: Five monoclonal antibodies directed against Streptococcus mutans strain JBP lipoteichoic acid (LTA) were characterized. They were all similarly reactive with the immunizing LTA-containing extract, with intact Strep. mutans JBP cells and with LTA purified from Lactobacillus casei. Immobilized anti-LTA antibodies removes LTA from LTA-containing extracts. The binding of antibodies to LTA was inhibited by the aqueous extract but not by the organic extract of de-acylated LTA, indicating reactivity with the polyglycerol-phosphate portion of the molecule. Antibodies were reactive with all serotypes of Strep. mutans, as well as with strains of Streptococcus salivarius, Streptococcus sanguis and L. casei, but not with LTA-negative species Streptococcus mitis or Actinomyces viscosus. Anti-LTA antibodies at doses of 0.3 or 3.0 .mu.g/ml, had no effect on the adherence of Strep. mutants JBP to experimental salivary pellicles formed on hydroxyapatite, but enhanced adherence 150-300 per cent at 30 .mu.g/ml. There was no effect of anti-LTA antibodies in a chemostat model which measured sucrose-dependent plaque accumulation by Strep. mutans. The results argue against a major role for LTA in Strep mutans adherence or plaque accumulation in vitro.

**The occurrence of teichoic acids in streptomycetes.**

Naumova I B; Kuznetsov V D; Kudrina K S; Bezzubenkov A P

Archives of microbiology (GERMANY, WEST) May 1980, 126 (1) p71-5,

Record type: Completed

Subfile: INDEX MEDICUS

The presence of teichoic acids in a number of streptomycetes led to the conclusion that these biopolymers were widely spread in genus *Streptomyces*. The nature of the teichoic acid present in the mycelium was determined by extracting it with 10% **trichloroacetic** acid, precipitating it with ethanol and identifying the precipitated polymer by partial acid and alkali hydrolysis to alditol, alditol phosphates and glycosylalditol phosphates. Most strains examined in this survey contained glycerol or ribitol teichoic acids; in some cases neither type was detected. Structurally teichoic acids closely resemble those of other genera of gram-positive bacteria and in many cases represent poly(glycerol phosphate) and poly(ribitol phosphate) chains. The proportion of alditol residues bearing sugar substituents varied widely. Three species of genus *Streptoverticillium* contained glycerol teichoic acids. It is believed that some of the data presented in this paper might be used with some success in taxonomic studies of streptomycetes.
